

### **AMENDMENTS TO THE SPECIFICATION**

Please amend paragraph 32 of the specification as follows.

[0032] FIGURE 7 shows the major functional grouping of several possible software program modules [[70]]. Management program 72 mediates between most of the other programs and is linked to the computer system's hardware through operating system 68. Management program 72 comprises several interrelated software modules [[70]], including an input/output program 74, a visual interface program 76, and a help program 78. A color selection program 80 controls the specialized color selection ability of system 10. When the user wishes to manually select (e.g., by comparing a color to a sample brought into the store) a color palette of colors is presented so that a preferred color or color range can be chosen (the range of colors being limited only by the limitations of the software and/or printer). A color match program 82 searches the database for "corresponding" colors that match or fall close to the scanned color (step 36), or searched color (step 42). When decorative elements 14 are saved in a database so that it may be accessed by the customer, database 87 software is used (for example) to search (step 42, step 50, step 60), "browse" (e.g. keyword searched), (step 44, step 48, step 58), and the like, files, and select the desired decorative element.
